

## Programming with WebGL Part 1: Background

CS 432 Interactive Computer Graphics  
Prof. David E. Breen  
Department of Computer Science

E. Angel and D. Shreiner: Interactive Computer Graphics 6E © Addison-Wesley 2012

1

## Objectives

- Development of the OpenGL API
- OpenGL Architecture
  - OpenGL as a state machine
  - WebGL as a data flow machine
- Functions
  - Types
  - Formats
- Simple program

E. Angel and D. Shreiner: Interactive Computer Graphics 6E © Addison-Wesley 2012

2

## Retained vs. Immediate Mode Graphics

- Immediate
  - Geometry is drawn when CPU sends it to GPU
  - All data needs to be resent even if little changes
  - Once drawn, geometry on GPU is discarded
  - Requires major bandwidth between CPU and GPU
  - Minimizes memory requirements on GPU
- Retained
  - Geometry is sent to GPU and stored
  - It is displayed when directed by CPU
  - CPU may send transformations to move geometry
  - Minimizes data transfers, but GPU now needs enough memory to store geometry

E. Angel and D. Shreiner: Interactive Computer Graphics 6E © Addison-Wesley 2012

3

## Early History of APIs

- IFIPS (1973) formed two committees to come up with a standard graphics API
  - Graphical Kernel System (GKS)
    - 2D but contained good workstation model
  - Core
    - Both 2D and 3D
  - GKS adopted as ISO and later ANSI standard (1980s)
- GKS not easily extended to 3D (GKS-3D)
  - Far behind hardware development

E. Angel and D. Shreiner: Interactive Computer Graphics 6E © Addison-Wesley 2012

4

## PHIGS and X

- Programmers Hierarchical Graphics System (PHIGS)
  - Arose from CAD community
  - Database model with retained graphics (structures)
- X Window System
  - DEC/MIT effort
  - Client-server architecture with graphics
- PEX combined the two
  - Not easy to use (all the defects of each)

E. Angel and D. Shreiner: Interactive Computer Graphics 6E © Addison-Wesley 2012

5

## SGI and GL

- Silicon Graphics (SGI) revolutionized the graphics workstation by implementing the graphics pipeline in hardware (1982)
- To access the system, application programmers used a library called GL
- With GL, it was relatively simple to program three dimensional interactive applications

E. Angel and D. Shreiner: Interactive Computer Graphics 6E © Addison-Wesley 2012

6

## OpenGL

---

The success of GL lead to OpenGL (1992), a platform-independent API that was

- Easy to use
- Close enough to the hardware to get excellent performance
- Focused on rendering
- Omitted windowing and input to avoid window system dependencies
- An immediate mode system, that later added retained mode functionality

E. Angel and D. Shreiner: Interactive Computer Graphics 6E © Addison-Wesley 2012 7

7

## OpenGL Evolution

---

- Originally controlled by an Architectural Review Board (ARB)
  - Members included SGI, Microsoft, Nvidia, HP, 3DLabs, IBM,.....
  - Now Khronos Group
  - Was relatively stable (through version 2.5)
    - Backward compatible
    - Evolution reflected new hardware capabilities
      - 3D texture mapping and texture objects
      - Vertex and fragment programs
  - Allows platform specific features through extensions

E. Angel and D. Shreiner: Interactive Computer Graphics 6E © Addison-Wesley 2012 8

8

## Modern OpenGL

---

- Performance is achieved by using GPU rather than CPU
- Control GPU through programs called shaders
- Application's job is to send data to GPU
- GPU does all rendering

```

    graph LR
      Vertices --> VP[Vertex processor]
      VP --> CPA[Clipper and primitive assembler]
      CPA --> R[Rasterizer]
      R --> FP[Fragment processor]
      FP --> Pixels
      style Vertices fill:none,stroke:none
      style Pixels fill:none,stroke:none
    
```

E. Angel and D. Shreiner: Interactive Computer Graphics 6E © Addison-Wesley 2012 9

9

## OpenGL 3.1 (2009)

---

- Totally shader-based
  - No default shaders
  - Each application must provide both a vertex and a fragment shader
- No immediate mode
- Few state variables
- Most 2.5 functions deprecated
  - *deprecate* in CS - To mark (a component of a software standard) as obsolete to warn against its use in the future, so that it may be phased out.
- Backward compatibility not required

E. Angel and D. Shreiner: Interactive Computer Graphics 6E © Addison-Wesley 2012 10

10

## Other Versions

---

- OpenGL ES
  - Embedded systems
  - Version 1.0 simplified OpenGL 2.1
  - Version 2.0 simplified OpenGL 3.1
    - Shader based
  - Version 3.0 simplified OpenGL 4.3
- WebGL 1.0
  - Javascript implementation of ES 2.0
  - Supported on newer browsers
- OpenGL 4.1 → 4.5
  - Added geometry & compute shaders and tessellator

E. Angel and D. Shreiner: Interactive Computer Graphics 6E © Addison-Wesley 2012 11

11

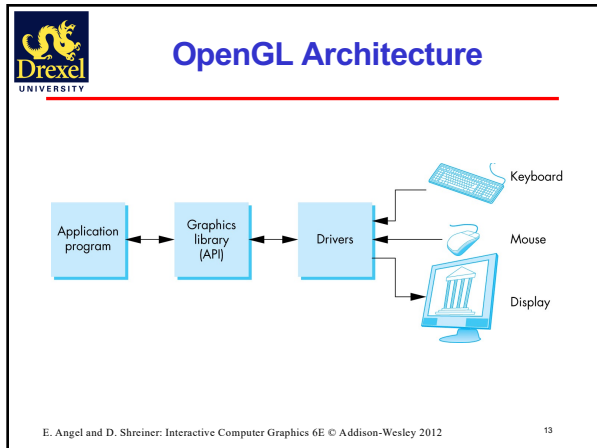

## What About Other Low-Level Graphics Libraries?

---

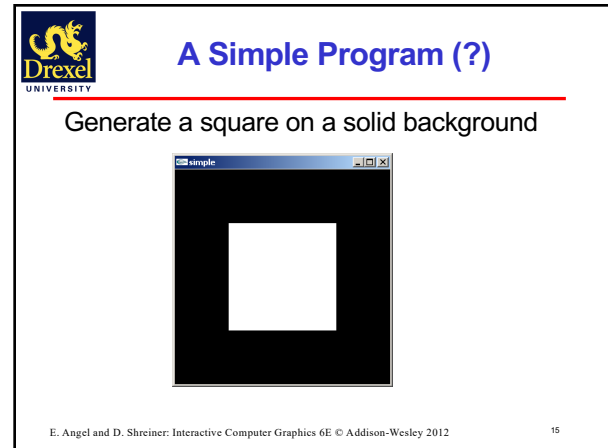

- Direct3D
  - Part of DirectX, Windows-only
- Mantle (discontinued)
  - Developed by AMD
- Metal
  - Developed by Apple
- Vulkan
  - "next-gen" OpenGL
  - Derived from Mantle

E. Angel and D. Shreiner: Interactive Computer Graphics 6E © Addison-Wesley 2012 12

12

13

15

## It used to be easy

```

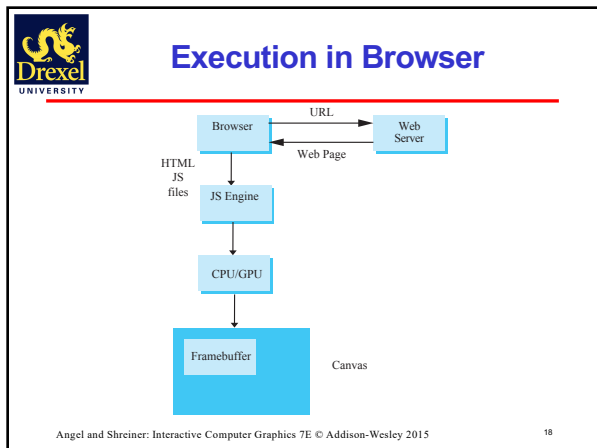

#include <GL/glut.h>
void mydisplay() {
    glClearColor(GL_COLOR_BUFFER_BIT);
    glBegin(GL_QUAD);
        glVertex2f(-0.5, -0.5);
        glVertex2f(-0.5, 0.5);
        glVertex2f(0.5, 0.5);
        glVertex2f(0.5, -0.5);
    glEnd()
}
int main(int argc, char** argv){
    glutCreateWindow("simple");
    glutDisplayFunc(mydisplay);
    glutMainLoop();
}
  
```

E. Angel and D. Shreiner. Interactive Computer Graphics 6E © Addison-Wesley 2012

16

- ## What happened?
- Most OpenGL functions deprecated
  - Made heavy use of state variable default values that no longer exist
    - Viewing
    - Colors
    - Window parameters
  - Current version makes the defaults more explicit
  - However, processing loop is the same
- E. Angel and D. Shreiner. Interactive Computer Graphics 6E © Addison-Wesley 2012

17

18

- ## Event Loop
- Remember that the sample program specifies a render function which is a *event listener* or *callback* function
    - Every program should have a *render* callback
    - For a static application we need only execute the render function once
    - In a dynamic application, the render function can call itself recursively but each redrawing of the display must be triggered by an event
- Angel and Shreiner. Interactive Computer Graphics 7E © Addison-Wesley 2015

19

 **Lack of Object Orientation**

- All versions of OpenGL are not object oriented so that there are multiple functions for a given logical function
- Example: sending values to shaders
  - `glUniform3f`
  - `glUniform2i`
  - `glUniform3dv`
- Underlying storage mode is the same

E. Angel and D. Shreiner: Interactive Computer Graphics 6E © Addison-Wesley 2012 21

21

 **WebGL function format**

Angel and Shreiner: Interactive Computer Graphics 7E © Addison-Wesley 2015 22

22

 **WebGL constants**

- Most constants are defined in the canvas object
  - In desktop OpenGL, they were in #include files such as `gl.h`
- Examples
  - desktop OpenGL
    - `glEnable(GL_DEPTH_TEST);`
  - WebGL
    - `gl.enable(gl.DEPTH_TEST)`
  - `gl.clear(gl.COLOR_BUFFER_BIT)`

Angel and Shreiner: Interactive Computer Graphics 7E © Addison-Wesley 2015 23

23

 **WebGL and GLSL**

- WebGL requires shaders and is based less on a state machine model than a data flow model
- Most state variables, attributes and related pre-3.1 OpenGL functions have been deprecated
- Action happens in shaders
- Job of application is to get data to GPU

Angel and Shreiner: Interactive Computer Graphics 7E © Addison-Wesley 2015 24

24

 **GLSL**

- OpenGL Shading Language
- C-like with
  - Matrix and vector types (2, 3, 4 dimensional)
  - Overloaded operators
  - C++ like constructors
- Similar to Nvidia's Cg and Microsoft HLSL
- Code sent to shaders as source code
- WebGL functions compile, link and get information to shaders

E. Angel and D. Shreiner: Interactive Computer Graphics 6E © Addison-Wesley 2012 25

25

 **Programming with OpenGL Part 2: Complete Programs**

E. Angel and D. Shreiner: Interactive Computer Graphics 6E © Addison-Wesley 2012 26

26

**Objectives**

- Build a complete first program
  - Introduce shaders
  - Introduce a standard program structure
- Simple viewing
  - Two-dimensional viewing as a special case of three-dimensional viewing
- Initialization steps and program structure

E. Angel and D. Shreiner: Interactive Computer Graphics 6E © Addison-Wesley 2012 27

27

**Coding in WebGL**

- Example: Draw a square
  - Each application consists of three types of files
- HTML (index.html)
  - describes canvas, i.e. page layout
  - includes utility scripts
  - includes application scripts
- JavaScript
  - contains the actual graphics code
- GLSL
  - contains shader code

Angel and Shreiner: Interactive Computer Graphics 7E © Addison-Wesley 2015 28

28

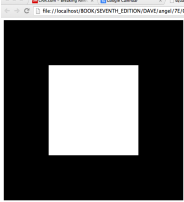

**Coding in WebGL**

- Can run WebGL on any recent browser
  - Chrome
  - Firefox
  - Safari
  - Edge
- Code written in JavaScript
- JS runs within browser
  - Use local resources

Angel and Shreiner: Interactive Computer Graphics 7E © Addison-Wesley 2015 29

29

**Square Program**

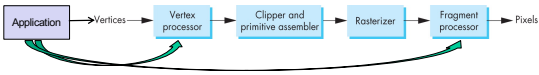

Angel and Shreiner: Interactive Computer Graphics 7E © Addison-Wesley 2015 30

30

**WebGL**

- Five steps
  - Describe page (HTML file)
    - request WebGL Canvas
    - read in necessary files
  - Define shaders (GLSL file)
  - Compute or specify data (JS file)
  - Send data to GPU (JS file)
  - Render data (JS file)

31

31

**index.html**

```

<!DOCTYPE HTML>
<html>
<head>
<script src="https://greggman.github.io/webgl-lint/webgl-lint.js"
crossorigin></script>
<script type="text/javascript" src="./Common/initShaders2.js"></script>
<script type="text/javascript" src="./Common/MVnew.js"></script>
<script type="text/javascript" src="./square.js"></script>
<script type="text/javascript" src="./app.js"></script>
</head>
<body>
<canvas id="gl-canvas" width="512" height="512">
Not supported
</canvas>
</body>
</html>

```

E. Angel and D. Shreiner: Interactive Computer Graphics 6E © Addison-Wesley 2012 32

32

 **Utility Files**

---

- **webgl-lint.js**: checks for common WebGL errors
  - See <https://github.com/greggman/webgl-lint>
- **../Common/initShaders2.js**: contains JS and WebGL code for reading, compiling and linking the shaders
- **../Common/MVnew.js**: matrix-vector package

Angel and Shreiner: Interactive Computer Graphics 7E © Addison-Wesley 2015

36

 **Application Files**

---

- **square.js**: contains JS & WebGL code for
  - defining square geometry
  - setting up shader programs
  - initializing buffers and pointers
  - drawing square
- **app.js**: contains JS & WebGL code for
  - initializing canvas and WebGL
  - render() function
  - instantiating square and rendering it

37

37

 **Shaders**

---

- We access shaders through their filenames in the JS file
- These are trivial pass-through (do nothing) shaders which set the
  - one required built-in variable (`gl_Position`) in the vertex shader
  - assign an output color for the fragment
- Note both shaders are full programs
- Note vector types `vec2` and `vec4`
- Must set precision in fragment shader

Angel and Shreiner: Interactive Computer Graphics 7E © Addison-Wesley 2015

40

 **Notes**

---

- **onload**: determines where to start execution when all code is loaded
- canvas gets WebGL context from HTML file
- vertices use `vec2` type in `MVnew.js`
- JS array is not the same as a C or Java array
  - object with methods
  - `vertices.length // 4`
- Values in clip coordinates

Angel and Shreiner: Interactive Computer Graphics 7E © Addison-Wesley 2015

41

 **Notes**

---

- **initShaders** used to load, compile and link shaders to form a program object
- Load data onto GPU by creating a **vertex buffer object** on the GPU
  - Note use of `flatten()` to convert JS array to an array of `float32's`
- Finally, we must connect variable in program with variable in shader
  - need name, type, location in buffer

Angel and Shreiner: Interactive Computer Graphics 7E © Addison-Wesley 2015

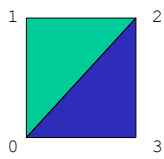

42

 **Drawing the square**

---

```
function render() {
  gl.clear( gl.COLOR_BUFFER_BIT );
  sq.draw();
}

draw() {
  ...
  gl.drawArrays( gl.TRIANGLE_FAN, 0, 4 );
  ...
}
```

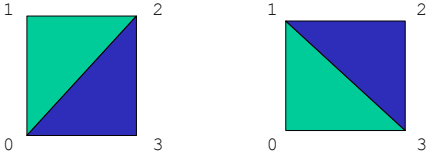

Angel and Shreiner: Interactive Computer Graphics 7E © Addison-Wesley 2015

43

 **Triangles, Fans or Strips**

---

```
gl.drawArrays( gl.TRIANGLE_FAN, 0, 4 ); // 0, 1, 2, 3
gl.drawArrays( gl.TRIANGLES, 0, 6 ); // 0, 1, 2, 0, 2, 3
```

```
gl.drawArrays( gl.TRIANGLE_STRIP, 0, 4 ); // 0, 1, 3, 2
```

Angel and Shreiner: Interactive Computer Graphics 7E © Addison-Wesley 2015

44

 **JavaScript Notes**

---

- JavaScript (JS) is the language of the Web
  - All browsers will execute JS code
  - JavaScript is an interpreted object-oriented language
- References
  - Flanagan, JavaScript: The Definitive Guide, O'Reilly
  - Crockford, JavaScript, The Good Parts, O'Reilly
  - Many Web tutorials

Angel and Shreiner: Interactive Computer Graphics 7E © Addison-Wesley 2015

45

 **JS Notes**

---

- Is JS slow?
  - JS engines in browsers are getting much faster
  - Not a key issues for graphics since once we get the data to the GPU it doesn't matter how we got the data there
- JS is a (too) big language
  - We don't need to use it all
  - Choose parts we want to use
  - Don't try to make your code look like C or Java

Angel and Shreiner: Interactive Computer Graphics 7E © Addison-Wesley 2015

46

 **JS Notes**

---

- Very few native types:
  - numbers
  - strings
  - booleans
- Only one numerical type: 64 bit float
  - var x = 1;
  - var x = 1.0; // same
  - potential issue in loops
  - two operators for equality == and ===
- Dynamic typing

Angel and Shreiner: Interactive Computer Graphics 7E © Addison-Wesley 2015

47

 **Scoping**

---

- Different from other languages
- Function scope
- variables are *hoisted* within a function
  - can use a variable before it is declared
- Note functions are first class objects in JS

Angel and Shreiner: Interactive Computer Graphics 7E © Addison-Wesley 2015

48

 **JS Arrays**

---

- JS arrays are objects
  - inherit methods
  - var a = [1, 2, 3];
    - is not the same as in C++ or Java
  - a.length // 3
  - a.push(4); // length now 4
  - a.pop(); // 4
  - avoids use of many loops and indexing
  - Problem for WebGL which expects C-style arrays

Angel and Shreiner: Interactive Computer Graphics 7E © Addison-Wesley 2015

49

## Typed Arrays

---

JS has typed arrays that are like C arrays

```
var a = new Float32Array(3)
var b = new Uint8Array(3)
```

Generally, we prefer to work with standard JS arrays and convert to typed arrays only when we need to send data to the GPU with the `flatten` function in `MVnew.js`

Angel and Shreiner: Interactive Computer Graphics 7E © Addison-Wesley 2015 50

50

## A Minimalist Approach

---

- We will use only core JS and HTML
  - no extras or variants
- No additional packages
  - CSS
  - JQuery
- Focus on graphics
  - examples may lack beauty

Angel and Shreiner: Interactive Computer Graphics 7E © Addison-Wesley 2015 51

51

## Buffer Object

---

- Buffer objects allow us to transfer large amounts of data to the GPU
- Need to create, bind (make current) and identify/specify data

```
var buffer_id;
buffer_id = gl.createBuffer();
gl.bindBuffer(gl.ARRAY_BUFFER, buffer_id);
gl.bufferData(gl.ARRAY_BUFFER, data,
              gl.STATIC_DRAW);
```

- Data in current buffer is sent to GPU

E. Angel and D. Shreiner: Interactive Computer Graphics 6E © Addison-Wesley 2012 52

52

## Why use Buffer Objects?

---

### Only Advantages

- The memory manager in the buffer object will put the data into the best memory locations based on user's hints
- Memory manager can optimize the buffers by balancing between 3 kinds of memory:
  - system, GPU and video memory

53

## gl.createBuffer()

---

- `gl.createBuffer()`
  - creates a buffer object and returns the buffer object

```
WebGLBuffer gl.createBuffer()
```

- Returns a `WebGLBuffer` for storing data such as vertices or colors.

55

## gl.bindBuffer()

---

- Once the buffer object has been created, we need to bind it to a target.
- Also makes the buffer "current"

```
void gl.bindBuffer(GLenum target, WebGLBuffer buffer)
```

- Target can be
  - `gl.ARRAY_BUFFER`: Any vertex attribute, such as vertex coordinates, texture coordinates, normals and color component arrays
  - `gl.ELEMENT_ARRAY_BUFFER`: Index array which is used for `glDraw[Range]Elements()`
- Once first called, the buffer is initialized with a zero-sized memory buffer and sets the initial states

56

## gl.bufferData()

---

- You can initialize and copy the data into the buffer object with gl.bufferData().

```
void gl.bufferData(GLenum target, GLsizei size,
                  GLenum usage)
void gl.bufferData(GLenum target, ArrayBuffer data,
                  GLenum usage)
```

- target is either GL\_ARRAY\_BUFFER or GL\_ELEMENT\_ARRAY\_BUFFER.
- size is the number of bytes of data to transfer.
- Data is the array holding the data to be copied.
- "usage" flag is a performance hint to provide how the buffer object is going to be used: static, dynamic or stream, and read, copy or draw.

57

## Usage Flags

---

- gl.STATIC\_DRAW
  - Contents of the buffer are likely to be used often and not change often.
- gl.DYNAMIC\_DRAW
  - Contents of the buffer are likely to be used often and change often.
- gl.STREAM\_DRAW
  - Contents of the buffer are likely to not be used often.

- All contents are written to the buffer, but not read.

58

## gl.bufferSubData()

---

```
void gl.bufferSubData(GLenum target,
                     GLintptr offset, ArrayBuffer data)
```

- Like gl.bufferData(),
  - used to copy data into BO
- It only replaces a range of data into the existing buffer, starting from the given offset.
- The total size of the buffer must be set by gl.bufferData() before using gl.bufferSubData().

60

## gl.deleteBuffer()

---

```
void gl.deleteBuffers(WebGLBuffer buffer)
```

- You can delete a BO with gl.deleteBuffer(), if it is no longer needed. After a buffer object is deleted, its contents will be lost.

61

## Program Execution

---

- WebGL runs within the browser
  - complex interaction among the operating system, the window system, the browser and your code (HTML and JS)
- Simple model
  - Start with HTML file
  - files read in asynchronously
  - start with onload function
    - event driven input

Angel and Shreiner: Interactive Computer Graphics 7E © Addison-Wesley 2015

63

## Coordinate Systems

---

- The units in **vertices** are determined by the application and are called *object*, *world*, *model* or *problem coordinates*
- Viewing specifications usually are also in object coordinates
- **GL\_Positions** are passed to clipping volume
  - Most important is *clip coordinates*
- Eventually pixels will be produced in *window coordinates*
- WebGL also uses some internal representations that usually are not visible to the application but are important in the shaders

Angel and Shreiner: Interactive Computer Graphics 7E © Addison-Wesley 2015

64

**Coordinate Systems and Shaders**

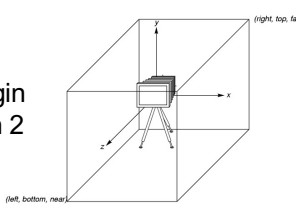

- Vertex shader must output vertices in clip coordinates
- Input to fragment shader from rasterizer is in window coordinates (pixels)
- Application can provide vertex data in any coordinate system, but vertex shader must eventually produce `gl_Positions` in clip coordinates
- Simple example uses clip coordinates

Angel and Shreiner: Interactive Computer Graphics 7E © Addison-Wesley 2015

65

**WebGL Camera**

- WebGL places a camera at the origin in camera space pointing in the negative  $z$  direction
- The view/clipping volume is a box centered at the origin with sides of length 2
- $(-1,-1,-1) \rightarrow (1,1,1)$

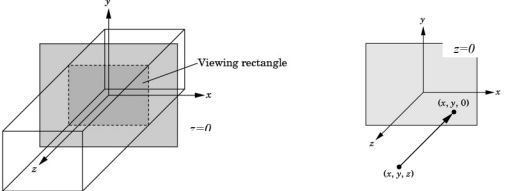

E. Angel and D. Shreiner: Interactive Computer Graphics 6E © Addison-Wesley 2012

66

**Orthographic Viewing**

In the default orthographic (parallel) view, all points in the view volume are projected along the  $z$  axis onto the plane  $z=0$ .

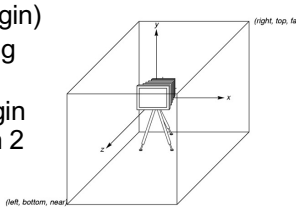

E. Angel and D. Shreiner: Interactive Computer Graphics 6E © Addison-Wesley 2012

67

**WebGL View Volume**

- Only geometry (`gl_Positions`) inside of view volume will be rendered!
- Doesn't matter if they are in front of or behind camera (origin)
- The viewing/clipping volume is a box centered at the origin with sides of length 2
- $(-1,-1,-1) \rightarrow (1,1,1)$

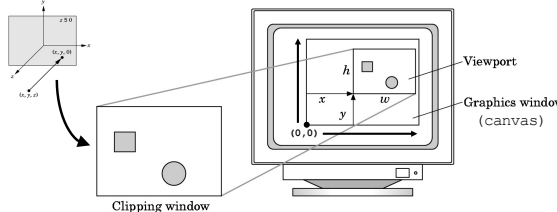

E. Angel and D. Shreiner: Interactive Computer Graphics 6E © Addison-Wesley 2012

68

**Viewing Rectangle Maps to Viewport**

Objects in the Viewing Rectangle are mapped into the Viewport  
Note the window's coordinate frame!

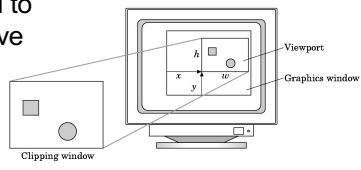

E. Angel and D. Shreiner: Interactive Computer Graphics 6E © Addison-Wesley 2012

69

**Viewports**

- Do not have to use the entire canvas for the image: `gl.viewport(x, y, w, h)`
- Values in pixels (window coordinates)
- `w` and `h` should be and `x` and `y` are recommended to be non-negative
- Specified in `square.js`

E. Angel and D. Shreiner: Interactive Computer Graphics 6E © Addison-Wesley 2012

70

## Transformations and Viewing

- In WebGL, projection is carried out by a projection matrix (transformation)
- Transformation functions are also used for changes in coordinate systems
- Pre 3.0 OpenGL had a set of transformation functions which have been deprecated
- Three choices
  - Application code
  - GLSL functions
  - MVnew.js

E. Angel and D. Shreiner: Interactive Computer Graphics 6E © Addison-Wesley 2012

71

## First Programming Assignment

- Get example code from HW1 web page
- Get test code running
- Make minor modifications to it
- Draw red pentagon, instead of a white square

72

## First Programming Assignment

- Change viewport (app.js)
- Add vertex/vertices to define another triangle (square.js)
- Modify gl.drawArrays() (square.js)
- Change output color (vshader.glsl)

73
